

Pepino mosaic virus

field diagnosis

Pepino mosaic virus is a highly contagious and damaging virus of Solanaceous crops.

- **Common name:** PepMV
- **Symptoms:** distorted leaves and stunted growth; chlorosis, bubbling and mosaic appearance on young leaves. A marbling appearance is seen on infected fruit. PepMV is a very contagious disease, easily spread by hands, tools or plant to plant contact.
- **Host range:** a narrow host range Solanaceous species, mainly tomatoes.
- **Test format:** lateral flow test in plastic cassette.

Designed for on-site use

All Pocket Diagnostic kits put disease diagnosis in the hands of growers, consultants and inspectors.

Sampling and testing can be carried out in a few minutes in the field or glasshouse. Pocket Diagnostic kits use a unique 'ball and bottle' extraction method which optimises separation of the pathogen from the plant tissues in no more than 60 seconds.

Results appear in the viewing window of the test device approximately 5 minutes after starting the test. The result is easy to read, allowing the user to make simple 'yes/no' interpretation.

Storage and shelf life

Pocket Diagnostic kits should be stored at room temperature (up to 40°C). Tests are supplied with at least a 9 month shelf life.

Quality standards

Pocket Diagnostic tests are manufactured under conditions which meet ISO9001 quality standards. Production and packaging are carried out in environmentally-controlled facilities, using the latest in automated manufacturing equipment.

Test kit packs

PepMV tests are supplied in boxes of four. Each box contains 4 test devices, 4 extraction bottles, 4 pipettes and full instructions. Test devices are packed in individual foil pouches, meaning that there is no loss of quality once the outer box is opened. Pocket Diagnostic kits contain everything necessary to carry out testing.

Use of the PepMV test

The *Pepino mosaic virus* test is designed to be used in the field or glasshouse, and can be used by operators with little or no training. Pocket Diagnostic test results form an important part of the information mix required for sound decision making in routine screening or disease control situations.

The Pocket Diagnostic *Pepino mosaic virus* test kit is used widely by growers of protected and field tomato crops for detection of the pathogen. Testing is usually carried out on symptomatic plants where the disease is suspected. Samples for testing should be taken from leaves with symptoms or skin from suspect tomato fruit. The tomato flesh should not be used as this inhibits the test.

Further information and ordering

For more information about the full range of Pocket Diagnostic kits, including prices, please visit www.pocketdiagnostic.com or contact us via +44 (0)1904 462600 or pocketdiagnostic@forsitediagnostics.com

Pocket Diagnostic kits can be ordered online via www.pocketdiagnostic.com or are available through our international network of distributors (full details on our website).
